

**Victoria Gold Corp. Reports Another Exceptional Gold Intersection From the Santa Fe Project**

**February 25, 2010 – Toronto, ON -Victoria Gold Corp. (VIT.TSX-V)** (“Victoria” or the “Company”) is pleased to report assay results from diamond drill hole BH-4 at the Santa Fe gold exploration project, Nevada.

**Drill Hole BH-4 Gold Assay Summary Table:**

		<b>From (m)</b>	<b>To (m)</b>	<b>Interval (m)</b>	<b>Grade (g/t)</b>
		132.6	135.6	3.0	0.505
		181.4	204.8	23.5	2.009
		206.3	249.9	43.6	3.023
Incl		217.0	234.7	17.7	4.111
	Incl	231.6	234.7	3.0	6.720
		259.1	274.3	15.2	0.714
		275.8	278.9	3.0	0.336
		280.4	313.0	32.6	1.267
Incl		292.6	294.1	1.5	4.114
		315.0	326.7	11.7	0.873
		337.4	363.2	25.8	1.310
		364.5	406.3	41.8	2.310
		409.3	413.0	3.7	0.422
		435.9	443.5	7.6	0.863
		445.0	448.1	3.0	0.393
		469.4	474.0	4.6	2.509
		487.7	493.8	6.1	0.620
		498.3	506.0	7.6	0.720

A plan view of the location of BH-4 (azimuth 45°, inclination –68°) is located at [www.vitgoldcorp.com](http://www.vitgoldcorp.com).

“BH-4 is clearly another exceptional exploration hole from Santa Fe”, said Chad Williams, President, CEO, and Director. “This hole was drilled below and at a considerable angle across each of BH-2 (309 m grading 2.25 g/t gold announced

October 22, 2009) and BH-3 (284 m grading 2.50 g/t announced January 12, 2010) and thus adds an important new dimension to what appears to be a very large gold system.”

Key observations about BH-4:

- BH-4 was designed to test for gold mineralization and to determine the spacial relationship between the mineralized zones and the numerous post-mineral faults located in the area.
- Most of the mineralized intervals included in the above table occur within a 231.6 m thick zone of gold mineralization from 181.4 to 413.0 m depth cut by several post mineral faults, and by dikes that have weak to no gold mineralization. The average grade of this entire zone is 1.63 g/t Au.
- The gold mineralization in BH-4 is manifested as veins and breccia zones with orientations generally ranging from 45°-65° angle to the core axis.
- Gold mineralization at Santa Fe remains open along strike and down dip. The true thickness of the mineralization intersected by BH-4 is not known at this time due to insufficient drilling to date.

The intended depth of BH-4 was 610 m, but the hole was extended to a down-hole depth of 657 m because of favourable alteration.

Two drills are currently turning at Santa Fe. Drill hole BH-5 is down to 670 m and thus nearing its target depth. Drilling of hole BH-6 recently started with a targeted depth of 610 m. The locations of BH-5 and BH-6 can also be seen at [www.vitgoldcorp.com](http://www.vitgoldcorp.com). Drill hole KR-1, which tested another structural intersection zone located northwest of the existing Santa Fe open-pit was recently completed and assays are pending.

## **Santa Fe Background**

Victoria has the right to earn from Homestake Mining Company of California, an indirect subsidiary of Barrick Gold Corporation (ABX-TSX, ABX-NYSE), up to a 70% interest in the Santa Fe gold property, which comprises 24 patented claims and 226 unpatented claims, by incurring exploration expenses in an aggregate amount of at least US\$6.5 million over a six year period. Victoria has also staked 42 unpatented claims adjacent to the Santa Fe project. Barrick Gold Corporation does not have a back-in right with respect to the Santa Fe project.

Drilling of BH-4 was carried out using HQ and NQ-sized core. The assays were prepared, processed and assayed by Inspectorate in Reno, NV. Assaying was done by fire assay with an atomic absorption ("AA") finish, and samples with AA results greater than 3,000 ppb were re-run by fire assay with gravimetric finish. Standards, blanks, and duplicate assays were also run for QA-QC. Assays shown include all intervals over 1.5 m and grading 0.300 g/t gold or more. Poor core recovery was experienced in the following intervals: 221.6 m to 228.6 m, 301.8 m to 313.0 m, 316.5 m to 323.7 m, 335.9 m to 349.1 m, 352.2 m to 361.2 m, 373.4 m to 377.3 m, and 380.4 m to 397.2 m. Numbers in the assay table may not add up due to rounding.

The technical contents in this press release were reviewed by Nancy J. Wolverson, Independent Consulting Geologist. She reviewed the analytical results and the QA/QC procedures in place at the facilities of the Company and the analytical laboratory. Ms. Wolverson is a Certified Professional Geologist (C.P. Geo.) through the American Institute of Professional Geologists (AIPG) and is a Qualified Person as defined in National Instrument 43-101. Dr. Raul Madrid, Vice President, Exploration of the Company, directs the drilling and logging procedures and is responsible for the geologic interpretation.

### **About Victoria**

Victoria is a high growth gold company with a focus on adding value per share through efficient exploration, project development, accretive acquisitions and effective marketing. Maintaining a low risk profile through project diversification, sound financial management, and operating in secure jurisdictions are key priorities for Victoria's management team.
